## DETAILED ACTION

### *Claim Rejections - 35 USC § 112*

1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

2. Claims 12, 13 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claim 12 is a method for producing a composite transform from a device A color space to a device B color space. However, device A color space and device B color space are not mentioned in the body of the claim. Instead, a destination and a source are claimed. Since the end product of the claim is a composite transform, there is no description or definition on how the composite transform is produced. The last step of the claim is the step of converting contents of a resulting transform back to the destination device space and not producing a composite transform. Clarification is needed.

Claim 13 claims the step of modifying a domain of the [device>PCS] transform from a destination device profile. "producing a modified [device>PCS] transform where the inking manifold controls gray component replacement" is indefinite since questions are raised on what produces the modified [device>PCS] (the domain, the transform, the ink manifold, or three input dimensions) or whether that is another step.

*Claim Rejections - 35 USC § 101*

3. 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

Claims 1-20 are rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter. The claims are directed toward a method for producing a composite transform from a device color space to another device color space by modifying and/or combining a source device to profile connection space transform and the destination device to profile connection space transform. As defined in the specification, a transform converts device coordinates to device independent PCS values (page 1, lines 30-31). This is considered to be non-functional descriptive material that does not exhibit any structural and functional relationship since the creation of a composite transform is merely data gathering, modification and compilation. Thus, the claimed invention does not have any practical application since descriptive material cannot exhibit any functional relationship with the way in which computer processes are performed.
